Technology And Soviet Energy Availability Technology Assessment Office Of 2019-09-05 Endowed with abundant energy resources, the Soviet Union is the world's largest oil producer and a major exporter of both oil and gas. Energy exports provide over half of Soviet hard-currency receipts, and subsidized energy sales to Eastern Europe are vital tools of Soviet influence in that region. Despite this enviable position, there have been indications in the past few years that the U.S.S.R. may soon face an energy shortage. In addition to examining the significance of U.S. petroleum equipment and technology for Soviet energy development, this book addresses the following questions: First, what opportunities and problems confront the U.S.S.R. in its five primary energy industries-oil, gas, coal, nuclear, and electric power-and what are plausible prospects for these industries in the present decade? Second, what equipment and technology are most needed by the U.S.S.R. in these areas, how much of each has been or is likely to be purchased from the West, and to what extent is the United States the sole or preferred supplier? Third, and perhaps most critical, how much difference could the West as a whole or the United States alone make to Soviet energy availability by 1990, and what are the implications of either providing or withholding such assistance for both the entire Soviet bloc and for the West?

Graphite Fluorides N. Watanabe 2013-10-22 This volume reviews the preparation, structures, physicochemical properties and applications of graphite fluorides, mainly based on the results obtained by the authors. Their interest in graphite fluorides stemmed from research on the "anode effect", in electrolytic production of fluorine gas in $KF \cdot 2HF$ melt using carbon electrodes. The formation of a thin graphite fluoride film on carbon anodes made it difficult to continue the electrolysis of $KF \cdot 2HF$ at a high current density. To elucidate this phenomenon studies on graphite fluoride were initiated. In the course of these systematic studies, the use of graphite fluoride in high-energy batteries became successful: a new graphite fluoride $(C_2F)_n$ was found; and another fluorine-graphite intercalation compound with ionic bonding, C_xF , was synthesized. During this research it was established that C_xF is closely associated with the "anode effect". The book will be of interest to all those involved in the study and research of graphite fluorides, particularly fluorine chemists, electrochemists, and fluorine and battery companies.
