Detailed System Optimization 2003 "The Mackenzie Gas Project (MGP) ... has been charged with furthering the designs conceived during the Snowy River Study through the regulatory application stage to transport natural gas and related liquids from the Mackenzie Delta to Alberta. ... The Design Concept Selection, Rev. C, October 9, 2003 considered dense phase, single phase and multi phase. ... Based on the additional technical challenges facing the multiphase concept in a remote environment, the single-phase concept was selected as the lead configuration for MGP. The subsequent Mainline Initial Optimization study, Rev. C July 15, 2003, identified the optimum pressure and diameter for the single-phase concept. ... The study concluded that the 18 MPa pressure range will provide the best coverage of the flow ranges and suggested that the NPS 30 is also the most appropriate pipe size. Since a gas pipeline with a design pressure of 18 MPa using NPS 30 coupled with a 10 MPa, NPS 10 NGL pipeline is the lead configuration based on previous work, it was used as the focal point for this study. The study includes a more thorough examination of the system to transport 34,000 E3m3/d and still be flexible to reduce or expand including evaluation of NPS 28 and NPS 32 systems for comparison. The analysis focused on taking the variable flow rate due to seasonal compression power variation into account and selecting the optimum configuration, including identification of station sites for facility siting work. In addition, sensitivity to the use of intermediate heaters as a means to minimize stranded compression power and confirmation of the technical and cost merits of internal coating were also undertaken for both the gas and NGL pipelines. Of the three pipeline sizes that were considered, the NPS 30 with 5 intermediate stations was identified as the lead configuration for the 34,000 E3m3/d target throughput. Station locations that were identified for site selection work using windows of ± 2.5 km are KP 133 (Northern Terminus), KP 358, KP 608.9 (Norman Wells), KP 833, KP 1066, and a heater station is located at KP 1259. This system also allows for the greatest flexibility across the desired operating range (24,000 E3m3/d to 54,000 E3m3/d). The corresponding NGL system should consist of an NPS 10 pipeline with no intermediate stations initially. The assumption that the pipeline should be internally coated was validated by both the 5% flow decrease in throughput if the pipe was not internally coated and the requirement to install two additional compressor stations if left uncoated to meet the target flow rates. The use of heaters to boost system capability using stranded compression power has technical merit but the flow rate increase is insufficient to reduce the number of compressor stations. The unheated system already meets the target flow rates of 34,000 E3m3/d so there is little incentive to pursue this concept. ... The resulting lead configuration from this study, which includes identified initial and expansion station locations, is documented in Revision 1 of ColtKBR's Technical Design Basis, April 16, 2003"--Executive summary.

Piping and Pipeline Calculations Manual Philip Ellenberger 2014-01-22 Piping and Pipeline Calculations Manual, Second Edition provides engineers and designers with a quick reference guide to calculations, codes, and standards applicable to piping systems. The book considers in one handy reference the multitude of pipes, flanges, supports, gaskets, bolts, valves, strainers, flexibles, and expansion joints that make up these often complex systems. It uses hundreds of calculations and examples based on the author's 40 years of experiences as both an engineer and instructor. Each example demonstrates how the code and standard has been correctly and incorrectly applied. Aside from advising on the intent of codes and standards, the book provides advice on compliance. Readers will come away with a clear understanding of how piping systems fail and what the code

requires the designer, manufacturer, fabricator, supplier, erector, examiner, inspector, and owner to do to prevent such failures. The book enhances participants' understanding and application of the spirit of the code or standard and form a plan for compliance. The book covers American Water Works Association standards where they are applicable. Updates to major codes and standards such as ASME B31.1 and B31.12 New methods for calculating stress intensification factor (SIF) and seismic activities Risk-based analysis based on API 579, and B31-G Covers the Pipeline Safety Act and the creation of PhMSA

Technology Standard of Pipe Rehabilitation Lu Wang 2021-02-12 This book summarizes the technical method and construction process of underground pipeline testing, cleaning, updating and repairing. It has 20 chapters and an appendix in total. Its content includes: Pipeline rehabilitation construction organization design, Pipeline cleaning, Preparations before construction, Pipeline detection and quality assessment, Pipeline rehabilitation design/method/equipment selection/steps/technical indicators, Pipe Cracking & Bursting method, Sliplining method, Pipe Segments Method, Lining with Inserted hose(improved) method, Cured in place pipe(CIPP), Spray lining, Spiral winding method, Spot repair method, universal construction techniques, construction of general rules, the engineering quality acceptance, construction health, safety, environmental protection and production management, and so on. The appendix is the interpretation for the relevant technical terms in this book. It could help the reader who doesn't have the basic knowledge about pipe rehabilitation to understand this technology easily. This regulation could be the fundamental discipline for pipeline renewal projects in different industries. It could provide the important basis and criterion for design, construction, management, inspection and acceptance of pipeline renewal projects.

Preliminary Investigations of Petroleum Spillage Warren E. Rickard 1972 The effect of various petroleum products on arctic and subarctic environments is of considerable importance. As part of the research effort into this problem, past fuel spills along the Haines to Fairbanks, Alaska military pipeline were investigated. Since the incorporation of the pipeline in 1956 there have been 40 reported ruptures in the 8-in.-diameter pipe that traverses 626 surface miles. Little new vegetation has grown in the areas of the spills. An inventory of new vegetation or lack of it is reported.

Niglintgak Lateral 2006 "The objective of this comparative study of buried and elevated pipelines within the Kendall Island Bird Sanctuary is to: establish key technical and operating issues and costs, and assess the potential environmental impacts of each option. This study focused on the Niglintgak lateral that will transport sweet natural gas and natural gas liquids (NGLs) in two-phase flow, at a maximum temperature of -1°C, across the Mackenzie Delta from the barge-mounted Niglintgak gas conditioning facility to the Taglu gas conditioning facility. This study describes the setting for the pipeline route and the potential hazards to both a buried and an elevated pipeline. It compares the pipelines' design, construction, revegetation, environmental impacts, operations, maintenance and abandonment. There are technical issues for an elevated pipeline in key areas of pipe materials, welding and pipeline operations which can be mitigated at a cost. The key concern with a buried pipeline is the greater area of terrain disturbance in an Arctic environment required for construction. This can also be effectively mitigated by reclamation. Where technically feasible, industry practice is to bury pipelines, considering cost, security and operations. The overall effects on vegetation of the elevated pipeline would be less than the low magnitude of effects of the buried pipeline. The overall amount of habitat that would be lost in the Kendall Island bird sanctuary from a buried pipeline is relatively small (1.33 ha). Therefore, it would have little impact on the availability of habitat for birds. A buried pipeline is preferred over an elevated pipeline because it will result in lower sensory disturbance during operations and will not provide additional nesting sites for avian predators or interfere with movements of wildlife. A conventional, uninsulated, buried pipeline is the most cost effective alternative for the Niglintgak lateral and costs at least \$10 million less. No technical or operability issues are foreseen for a buried pipeline. The effects on the terrain and wildlife habitat caused by ditching can be effectively mitigated by design, construction, reclamation and revegetation measures. The comparisons

between an elevated and buried pipeline are summarized in Table 1"--P. i.

Pipeline Engineering (2004) Henry Liu 2017-11-22 Pipeline engineering has struggled to develop as a single field of study due to the wide range of industries and government organizations using different types of pipelines for all types of solids, liquids, and gases. This fragmentation has impeded professional development, job mobility, technology transfer, the diffusion of knowledge, and the movement of manpower. No single, authoritative course or book has existed to unite practitioners. In response, Pipeline Engineering covers the essential aspects and types of pipeline engineering in a single volume. This work is divided into two parts. Part I, Pipe Flows, delivers an integrated treatment of all variants of pipe flow including incompressible and compressible, Newtonian and non-Newtonian, slurry and multiphase flows, capsule flows, and pneumatic transport of solids. Part II, Engineering Considerations, summarizes the equipment and methods required for successful planning, design, construction, operation, and maintenance of pipelines. By addressing the fundamentals of pipeline engineering-concepts, theories, equations, and facts-this groundbreaking text identifies the cornerstones of the discipline, providing engineers with a springboard to success in the field. It is a must-read for all pipeline engineers.
