The principle of thermodynamics are summarized in four laws, they are

1. Zeroth law of thermodynamics deals with thermal equilibrium and provides a means of measuring temperature.
2. The first law of thermodynamics tells about the conservation of energy and introduces the concept of internal energy.
3. Webfor a good understanding of topics in thermodynamics. Thermodynamics and Energy Thermodynamics can be defined as the study of energy, energy transformations and its relation to matter. The analysis of thermal systems is achieved through the application of the governing conservation equations, namely Conservation of WebAfter the first three chapters, which refer to key concepts (first and second laws, energy, entropy, work, heat, ...), more advanced notions of thermodynamics are discussed (potentials and thermodynamic functions, thermoelastic coefficients, phase diagrams,

binary solutions,...). According to classical thermodynamics, we consider the energy added to be net heat transfer to the closed system and the energy leaving the closed system to be net work done by the closed system. So  $Q_{net} - W_{net} = \Delta E_{system}$ . Normally the stored energy, or total energy, of a system is expressed as the sum of three separate energies. Thermodynamics is a science dealing with Energy and its transformation and its effect on the physical properties of substances. It deals with equilibrium and feasibility of a process. Deals with the relationship between heat and work and the properties of systems in equilibrium.
