Mathematics for Machine Learning Marc Peter Deisenroth 2020-04-23 The fundamental mathematical tools needed to understand machine learning include linear algebra, analytic geometry, matrix decompositions, vector calculus, optimization, probability and statistics. These topics are traditionally taught in disparate courses, making it hard for data science or computer science students, or professionals, to efficiently learn the mathematics. This self-contained textbook bridges the gap between mathematical and machine learning texts, introducing the mathematical concepts with a minimum of prerequisites. It uses these concepts to derive four central machine learning methods: linear regression, principal component analysis, Gaussian mixture models and support vector machines. For students and others with a mathematical background, these derivations provide a starting point to machine learning texts. For those learning the mathematics for the first time, the methods help build intuition and practical experience with applying mathematical concepts. Every chapter includes worked examples and exercises to test understanding. Programming tutorials are offered on the book's web site.

Essential English Skills for the Australian Curriculum Year 7 Anne-Marie Brownhill 2012-09-13 ESSENTIAL ENGLISH SKILLS YEAR 7 FOR THE AUSTRALIAN CURRICULUM has been revised to cover the language and literacy strands of the Australian Curriculum: English with a focus on introducing key language and literacy skills in Years 7&8 and consolidating and developing those skills in Years 9&10. Units in each workbook are organised by skill and cover grammar, punctuation, spelling, vocabulary, reading, comprehension, writing and editing. Explicit teaching pages for each unit carefully explain the required skills, allowing students to work independently in class or at home. Three levels of graded exercises extend on from the proceeding level, giving every student an achievable starting point and the opportunity to extend their skills. A phonics approach to spelling helps students develop a secure grasp of the essential sound and spelling patterns. A cognitive model for comprehension allows students to learn about certain language and text features as they are reading. Strong focus on vocabulary development and grammar basics ensure students can apply basic concepts to their own writing across disciplines as well as in the English classroom. Proofreading and editing tools encourage students to review their own work and equip them with the skills they need to develop their writing and language use. Writing challenges invite students to apply the concepts they have learnt in short written exercises. Interacting challenges provide opportunities for oral work and interactions with other students. New digital based exercises (Wiki Tasks, Website Explorer and Technology challenge ICT exercises) are fully integrated within the text to extend learning and encourage students to apply knowledge. The Australian Curriculum strands are explicitly identified allowing easy indication of the material that fits into the strands. Solutions are available on Cambridge GO for teachers. No code is required to access these resources, but access is only available through a Cambridge GO Teacher Account.

Deep Learning Ian Goodfellow 2016-11-10 An introduction to a broad range of topics in deep learning, covering mathematical and conceptual background, deep learning techniques used in industry, and research perspectives. "Written by three experts in the field, Deep Learning is the only comprehensive book on the subject." —Elon Musk, cochair of OpenAI; cofounder and CEO of Tesla and SpaceX Deep learning is a form of machine learning that enables computers to learn from experience and understand the world in terms of a hierarchy of concepts. Because the computer gathers knowledge from experience, there is no need for a human computer operator to formally specify all the knowledge that the computer needs. The hierarchy of concepts allows the computer to learn complicated concepts by building them out of simpler ones; a graph of these hierarchies would be many layers deep. This book introduces a broad range of topics in deep learning. The text offers mathematical and conceptual background, covering relevant concepts in linear algebra, probability theory and information theory, numerical computation, and machine learning. It describes deep learning techniques used by practitioners in industry, including deep feedforward networks, regularization, optimization algorithms, convolutional networks, sequence modeling, and practical methodology; and it surveys such applications as natural language processing, speech recognition, computer vision, online recommendation systems, bioinformatics, and videogames. Finally, the book offers research perspectives, covering such theoretical topics as linear factor models, autoencoders, representation learning, structured probabilistic models, Monte Carlo methods, the partition function, approximate inference, and deep generative models. Deep Learning can be used by undergraduate or graduate students planning careers in either industry or research, and by software engineers who want to begin using deep learning in their products or platforms. A website offers supplementary material for both readers and instructors.
