## **Control Chart for Failure-Censored Reliability Tests under Uncertainty Environment**

Muhammad Aslam Existing control charts based on failure-censored (Type-II) reliability tests were designed using classical statistics. Classical statistics was applied for the monitoring of the process when observations in the sample or the population were determined. Neutrosophic statistics (NS) are applied when there is uncertainty in the sample or population. In this paper, a control chart for failure-censored (Type-II) reliability tests was designed using NS. The design of a control chart for the Weibull distribution, which is applied when there is a lack of symmetry using neutrosophic statistics, is given. The proposed control chart was used to monitor the neutrosophic mean and neutrosophic variance, which are related to the neutrosophic scale parameter. The advantages of the proposed control chart over the existing control chart are discussed.

## **Monitoring of production of blood components by attribute control chart under indeterminacy**

Nasrullah Khan The existing control chart for monitoring the blood components by attribute is designed using classical statistics. The existing attribute control chart can be applied only when the experimenter is sure about the proportion of defective or all the observations in the sample are determined. In this paper, new attribute control charts for monitoring the blood components under the neutrosophic statistics will be presented. The design of the proposed control chart is given under the neutrosophic statistical interval method. The applications of these control charts demonstrate that the proposed control charts are quite effective, adequate, flexible, and informative for monitoring the blood components under uncertain environment.

Nonparametric Statistical Process Control Subhabrata Chakraborti 2019-04-29 A unique approach to understanding the foundations of statistical quality control with a focus on the latest developments in nonparametric control charting methodologies Statistical Process Control (SPC) methods have a long and successful history and have revolutionized many facets of industrial production around the world. This book addresses recent developments in statistical process control bringing the modern use of computers and simulations along with theory within the reach of both the researchers and practitioners. The emphasis is on the burgeoning field of nonparametric SPC (NSPC) and the many new methodologies developed by researchers worldwide that are revolutionizing SPC. Over the last several years research in SPC, particularly on control charts, has seen phenomenal growth. Control charts are no longer confined to manufacturing and are now applied for process control and monitoring in a wide array of applications, from education, to environmental monitoring, to disease mapping, to crime prevention. This book addresses quality control methodology, especially control charts, from a statistician's viewpoint, striking a careful balance between theory and practice. Although the focus is on the newer nonparametric control charts, the reader is first introduced to the main classes of the parametric control charts and the associated theory, so that the proper foundational background can be laid. Reviews basic SPC theory and terminology, the different types of control charts, control chart design, sample size, sampling frequency, control limits, and more Focuses on the distribution-free (nonparametric) charts for the cases in which the underlying process distribution is unknown Provides guidance on control chart selection, choosing control limits and other quality related matters, along with all relevant formulas and tables Uses computer simulations and graphics to illustrate concepts and explore the latest research in SPC Offering a uniquely balanced presentation of both theory and practice, *Nonparametric Methods for Statistical Quality Control* is a vital resource for students, interested practitioners, researchers, and anyone with an appropriate background in statistics interested in learning about the foundations of SPC and latest developments in NSPC.

*Monitoring the Variability in the Process Using Neutrosophic Statistical Interval Method* Muhammad Aslam Existing variance control charts are designed under the assumptions that no uncertain, fuzzy and imprecise observations or parameters are in the population or the sample. Neutrosophic statistics, which is the extension of classical statistics, has been widely used when there is uncertainty in the data. In this paper, we will originally design S2 control chart under the neutrosophic interval methods.

Improving Healthcare with Control Charts Raymond G. Carey 2003-01-01 Do you feel you are drowning in a sea of data and wondering how you can learn from all of this information? While measuring quality efforts in healthcare is essential to the overall performance of any healthcare organization, it is also very complex, leaving many feeling overwhelmed and with a lot of unanswered questions: What are SPC methods and can they really help to improve healthcare? How can control charts be used to monitor key processes and outcomes? How can physicians use control charts to improve their clinical practice? In his latest book, Dr. Raymond Carey answers these questions and more as he helps to explain the need for, and the use of, SPC in healthcare. In *Improving Healthcare with Control Charts: Basic and Advanced SPC Methods and Case Studies*, Carey expands on his previous best-selling book, *Measuring Quality Improvement in Healthcare*, by providing more in-depth information on problems commonly experienced in constructing and analyzing control charts. He outlines specific SPC concepts, theories, and methods that will help improve measurement and therefore improve overall performance. Carey also presents many new case studies applying advanced methods and theory to real life healthcare situations.

Control Charts for Statistical Process Control - a Literature Overview Anika Johlke 2023 Control charts are a widely used tool for statistical process control and have been continuously researched and applied for several decades. If the underlying assumptions are guaranteed, traditional charts such as the Shewhart, EWMA or CUSUM chart are a reasonable choice for monitoring production or service processes. However, with the increasing availability of data and the need for more complex monitoring processes, these charts have evolved, resulting in a broad and diverse field of research. This literature overview aims to categorize the different characteristics of control charts, including general and specific types of control charts, different types of data, multivariate and distribution-free charts, computation methods, and the economic approach to designing a control chart. In particular, a categorization scheme for different performance metrics is provided, which is the first of its kind.

This overview offers a brief summary of all categories, outlines representative and high-quality articles, introduces the most influential authors in the field, and suggests several areas for future research. Unlike recent literature reviews, we do not focus on a specific property of control charts, but rather provide a comprehensive overview. Research on this topic has not ceased at all, in fact it has increased in the past two years, emphasizing the continued importance of control charts.

**On Small Sample Probability Limits for Control Charts** Chung-how Yang 1967 The paper considers the problem of how a small number of subgroups may be used to set control limits for Shewhart control charts so that these limits will yield the desired probability of a Type I error on each subgroup tested. Such small sample probability limits are developed both for testing future subgroups and, by suitable modifications, for retrospectively testing the initial subgroups. To increase the power of the test, the sample variance or average subgroup variance is used to establish these limits for several new charts for controlling the central tendency or dispersion of the process. In addition, previous derivations of the small sample probability limits for testing future subgroups on the X bar and R chart are supplemented here by deriving the corresponding limits for retrospective testing. Finally, an alternative method is presented for calculating probability limits for the p chart and c chart when the process parameter is either known or prespecified as a target value. Tables of the factors for calculating the various probability limits also are presented wherever appropriate. (Author).

#### Design of a Control Chart Based on COM-Poisson Distribution for the Uncertainty Environment

Muhammad Aslam This paper will introduce the neutrosophic COM-Poisson (NCOM-Poisson) distribution. Then, the design of the attribute control chart using the NCOM-Poisson distribution is given. The structure of the control chart under the neutrosophic statistical interval method will be given. The algorithm to determine the average run length under neutrosophic statistical interval system will be given. The performance of the proposed control chart is compared with the chart based on classical statistics in terms of neutrosophic average run length (NARL). A simulation study and a real example are also added. From the comparison of the proposed control chart with the existing chart, it is concluded that the proposed control chart is more efficient in detecting a shift in the process. Therefore, the proposed control chart will be helpful in minimizing the defective product. In addition, the proposed control chart is more adequate and effective to apply in uncertainty environment.

#### **A New X-Bar Control Chart for Using Neutrosophic Exponentially Weighted Moving Average**

Muhammad Aslam The existing Shewhart X-bar control charts using the exponentially weighted moving average statistic are designed under the assumption that all observations are precise, determined, and known. In practice, it may be possible that the sample or the population observations are imprecise or fuzzy. In this paper, we present the designing of the X-bar control chart under the symmetry property of normal distribution using the neutrosophic exponentially weighted moving average statistics. We will first introduce the neutrosophic exponentially weighted moving average statistic, and then use it to design the X-bar control chart for monitoring the data under an uncertainty environment. We will determine the neutrosophic average run length using the neutrosophic Monte Carlo simulation. The efficiency of the proposed plan will be compared with existing control charts.

#### Control Chart for Variance Using Repetitive Sampling Under Neutrosophic Statistical Interval

System Muhammad Aslam In this paper, a control chart for variance using the repetitive sampling under the neutrosophic statistics is proposed. The proposed control chart can be applied for monitoring the variability in the process when some observations/parameters are unclear and indeterminate. The operational procedure of the proposed control chart and the necessary measures are given for the practical use of the proposed control chart. The control chart parameters are determined through the algorithm under neutrosophic statistical interval method. The efficiency of the proposed control chart is compared with the existing control chart in neutrosophic average run length. From the simulation study and a real example, it is concluded that the proposed control chart is more efficient in detecting a shift in the process and more adequate, effective, informative, and exible under the uncertainty environment.

**Statistical Models and Control Charts for High-Quality Processes** Min Xie 2012-12-06 Control charts are widely used in industry to monitor processes that are far from Zero-Defect (ZD), and their use in a near Zero-Defect manufacturing environment poses many problems. This book presents techniques of using control charts for high-quality processes, and some recent findings and applications of statistical control chart techniques for ZD processes are presented. A powerful technique based on counting of the cumulative conforming (CCC) items between two nonconforming ones is discussed in detail. Extensions of the CCC chart are described, as well as applications of cumulative sum and exponentially weighted moving average techniques to CCC-related data, multivariate methods, economic design of control chart procedures, and modeling and analysis of trended but regularly adjusted processes.
