Teaching Machines and Programming K. Austwick 2014-05-12

Teaching Machines and Programming covers the significant developments in teaching machines and automated teaching, as well as the major theoretical issues and attributes involved in these procedures. After a brief introduction to teaching machine procedures, this six-chapter text goes on summarizing the industrial and military applications of teaching machines. The succeeding chapters consider the underlying theory, function, and schema of the adaptive teaching system, which are related to recognizable teaching functions performed by a human tutor. The last chapters discuss the development and features of linear programs and their application as new teaching aid. These chapters also look into some practical problems arising in programming for schools. This book will prove useful to computer programmers, school administrators, teachers, and students.

Developing Student Autonomy in Learning Boud, David

2012-11-12 First Published in 1987. The assumption about the purpose of education, to which the authors of this book subscribe, is that it is to produce autonomous lifelong learners. This book is about a very important goal of education and how it can be translated into practice. It concerns ways in which teachers in higher education can enable students to become more autonomous in their learning; that is, assist students to learn more effectively without the constant presence or intervention of a teacher.

Child-Centred Education Harold Entwistle 2011-12-08 This volume is a critical study of one of today's most controversial topics in educational theory, setting the many arguments in perspective and clarifying the issues that arise when attention is focused on the learner. The author examines the problems of individual education, the distinctive demands childhood makes on the school and the claims of social education. The related questions of freedom, authority and discipline are then discussed, together with the ways in which curriculum development must take account of the learner's interests, needs and dispositions in preparing him/her for life. The concept of educating the whole person is critically examined, together with the claim that education for life and the development of personal integrity require an integrated curriculum. Since child-centred educational theory is often dismissed as irrelevant to practice, the book concludes with an assessment of the various limitations which concern with practical activity imposes on educational theorists.

The Matrix Ate My Baby Andrew Gibbons 2007-01-01 The book interrogates the value of play as an essential component of learning, and the essential role of play in a technological society's aspirations for progress. Drawing upon the philosophy of technology, this book provides parents, teachers and teacher educators with a critique of predominant perspectives regarding the young child's increasingly hi-tech world.

Teaching Machines Audrey Watters 2023-02-07 How ed tech was
born: Twentieth-century teaching machines--from Sidney
Pressey's mechanized test-giver to B. F. Skinner's behaviorist
bell-ringing box. Contrary to popular belief, ed tech did not begin
with videos on the internet. The idea of technology that would
allow students to "go at their own pace" did not originate in
Silicon Valley. In *Teaching Machines*, education writer Audrey
Watters offers a lively history of predigital educational
technology, from Sidney Pressey's mechanized positive-
reinforcement provider to B. F. Skinner's behaviorist bell-ringing
box. Watters shows that these machines and the pedagogy that
accompanied them sprang from ideas--bite-sized content,
individualized instruction--that had legs and were later picked up
by textbook publishers and early advocates for computerized
learning. Watters pays particular attention to the role of the
media--newspapers, magazines, television, and film--in shaping
people's perceptions of teaching machines as well as the
psychological theories underpinning them. She considers these
machines in the context of education reform, the political
reverberations of Sputnik, and the rise of the testing and textbook
industries. She chronicles Skinner's attempts to bring his

teaching machines to market, culminating in the famous behaviorist's efforts to launch Didak 101, the "pre-verbal" machine that taught spelling. (Alternate names proposed by Skinner include "Autodidak," "Instructomat," and "Autostructor.") Telling these somewhat cautionary tales, Watters challenges what she calls "the teleology of ed tech"--the idea that not only is computerized education inevitable, but technological progress is the sole driver of events.
